WARNING: VSO ConvertXToDVD v4.1.10.348 PR + serials setup free will install nagware and malware viruses. Download Crack or Serial. Blood components are usually separated by centrifugal force and or filtration to obtain plasma and red cells for use in transfusions. Artificial red cells (erythrocytes) are much smaller than erythrocytes. Thus, it is often desirable to manipulate the cells in their membrane-containing media, in order to determine the integrity of the cells or the ability of the cells to perform their intended function. At present, erythrocytes are isolated from whole blood by centrifugation and then must be resuspended in a hypotonic solution, to obtain the material necessary for the desired tests. The time required to obtain the required material, causes the cells to be lost as well as the need to maintain cells in an environment prior to the desired test procedure that is unsuitable for the desired test. It is therefore, a principal object of the present invention to provide a method and apparatus for obtaining a sample of whole blood, isolating a desired sub-population of cells from the whole blood and obtaining material for a specific use. A further object of the present invention is to provide a method and apparatus for obtaining a sample of whole blood, isolating a desired sub-population of cells from the whole blood and obtain a sample of the desired sub-population for an analysis or a determination. A still further object of the present invention is to provide a method and apparatus for obtaining a sample of whole blood, isolating a desired sub-population of cells from the whole blood, obtaining a sample of the desired sub-population for an analysis or a determination and obtaining a serum sample of the whole blood without using centrifugation. A further object of the present invention is to provide a method and apparatus for obtaining a sample of whole blood, isolating a desired sub-population of cells from the whole blood, obtaining a sample of the desired sub-population for an analysis or a determination and obtaining a platelet rich plasma (PRP) sample of the whole blood without using centrifugation. A further object of the present invention is to provide a method and apparatus for obtaining a sample of whole blood, isolating a desired sub-population of cells from the whole blood, obtaining a sample of

the desired sub-population for an analysis or a determination and obtaining a platelet poor plasma (PPP) sample of the whole blood
